C. UNPACKING INSTRUCTIONS

1. Open the box and remove the top layer of foam. The following items will now be visible:

- 1 STEALTH D/A Converter
- 1 AC power cord
- 1 Packet containing the Owners Reference and warranty card

NOTE: If any of these items are not included please contact your authorized dealer immediately for assistance.

2. Carefully remove the unit and accessories from the box and remove the protective plastic wrap from the unit.

NOTE: Save all packing materials. If you must ship your STEALTH in the future, repack the unit in its original packaging to prevent transit damage.

3. Remove the voltage identification sticker on the back of the unit.

D. BASIC INSTALLATION AND OPERATION

Before you install the STEALTH into your system we recommend that you follow these guidelines in choosing the location. This will facilitate a clean, trouble-free installation.

CAUTION: When making connections to this component or any other, make sure the power amplifier is OFF and the preamplifier is in the MUTE or STANDBY mode.

1. Although well shielded, the processor should not be placed in close proximity to hum-sensitive components (i.e. preamps, turntables, tuners, etc.)

2. As with any high quality component, ensure that the vent openings in the chassis are free from obstruction, allowing the processor to dissipate heat created by its highly regulated power supply and high bias Class A output stage.

3. Place the unit on a clean, level surface away from excessive heat or moisture.

4. Connect the AC power cord to the back of the unit. Once the power cord is secured, plug the other end into an AC outlet. The O degree, Source and Coax 1 LEDs will illuminate, indicating the digital signal processor is powered.

Should your unit not perform as described above, unplug the unit from the AC outlet and contact your local Krell dealer or the Krell factory.

NOTE: While the STEALTH has superb regulation and does not require a dedicated AC circuit, we strongly advise against any connections through extension cords or multiple AC adaptors. High quality 15 amp grounded AC strips are acceptable.

CAUTION: Do not remove or bypass the ground pin on the end of the AC cord. This may cause RFI (radio frequency interference) to be induced into your playback system.

E. INPUT AND OUTPUT CONNECTIONS

1. Connect the Stealth analog output to the line level input of your preamplifier.

The STEALTH is equipped with two output configurations: Single-ended via RCA connectors and Balanced via XLR connectors. If your preamplifier has high level balanced inputs we recommend the balanced outputs of the processor be used. There are considerable sonic benefits associated with the use of this type of interconnection. High quality tri-axial cable should be used for balanced interconnects. This type of cable is considerably different from cable normally used for single-ended interconnects.

NOTE: The two outputs can be used to simultaneously feed two different systems.

NOTE: If you decide to use the single-ended analog outputs, the type of interconnect cable should be chosen carefully. High quality shielded cable is suggested. The red banded connector indicates the right channel and the white indicates the left channel.

Care should be taken to insure that the channel orientation between the processor and the high level inputs of your preamplifier are maintained.

2. Connect the digital output of your CD transport and other digital sources to the inputs of the STEALTH; Coax 1, Coax 2, Fibre Optic or XLR. If you are using multiple digital sources, take note of where each input and corresponding switch setting is located.

The STEALTH is equipped with two coaxial digital inputs, a standard fibre optic digital input and a balanced digital input for use with Compact Disc players, Laser Disc players, DATs or satellite receivers. An AT&T wide bandwidth fibre optic input is also available as a special option. All of the inputs can accept a signal from any digital source. When a powered digital source is introduced to an input and that input is selected with the Input switch, the signal LED will illuminate.

NOTE: If the digital source is ON and the signal LED does not illuminate, check to make sure the digital interconnect cable is secure at both ends or is not in need of repair.

NOTE: Care should be taken in selecting the type of cable used to link the digital source to your processor. If coaxial cable is to be used, it should be non-capacitive and have a bandwidth in excess of 10MHZ to prevent drop-out errors.

NOTE: If an optical cable is selected we strongly recommend that it be a high quality Quartz fibre cable or the optional AT&T fibre optic cable. A benefit of using an optics interconnect is that it reduces the ground loop problems often associated with quality audio systems.

3. Connect the digital output of the STEALTH to the input of a digital recording device. Then connect the digital output of the recorder to the TAPE input on the STEALTH.

A digital Tape Record Output is provided via an RCA connector. This output is used to feed the digital input of a digital recording device. The Tape input is provided for any digital source and can be used as an additional input. It should be used for the output of a digital recording device to avoid the possibility of creating a feedback loop.

4. Once you have completed the necessary input and output connections, select the input of your choice. For each input selected, the corresponding LED will illuminate when the digital input source (must have its power ON) and the processor have linked.

F. PROCESSOR OPERATION AND DIGITAL TAPE LOOP

1. Select an input with the Input switch. Notice the Signal LED will illuminate when the digital source is turned on and has linked with the processor. Once this link is complete the processor is ready to pass a signal.
2. Be sure that your preamplifier's volume control is completely turned to the OFF (lowest volume) position.
3. Turn ON your components, remembering that the last component to be energized should be your amplifier. The amplifier should only be turned ON after all other components in the system have been on for at least two minutes. This will insure that there will not be any large pulse created when the amplifier is turned on.
4. Switch the selector source of your preamp to the position correlating to your chosen input connection for the STEALTH.
5. You may now start playing your digital source, DAT, CD or satellite.
6. Slowly turn the volume control up to the lowest level you can hear. Check to see that both channels are working correctly before advancing the volume.

NOTE: While your STEALTH will perform beautifully from the moment you turn it on, it requires a minimum warm up period of 8 hours before it will reach its full sonic potential. Discrete components are utilized in the analog output stage and the warm up period allows them to reach thermal equilibrium.

Your installation is now complete. Should you have any further questions which are not covered in the remainder of this manual, contact your authorized Krell dealer. We wish you many hours of listening fulfillment.

STEALTH FEATURES

DIGITAL TAPE LOOP

The Tape output is used as a direct digital output for a digital recording system. The digital source you want to record is selected by the Input switch. To listen to the digital source select Source on the Source/Monitor switch. To listen to the Tape output during or after the recording select Monitor on the Source/Monitor switch.

NOTE: The Tape input can also be used as an additional source input.

CAUTION: The Tape output is a digital signal and can not be used as an analog output to drive front end components such as a preamplifier.

PHASE SWITCH

The Phase Switch can reverse output phase. In some studio recordings the master tape was recorded out of phase, creating unusually poor sounding recordings. The STEALTH can reverse the normal 0 degree output phase 180 degrees to correct for this anomaly. Utilizing the Phase Switch can, in some instances, restore life to a previously dull sounding recording.

EMPHASIS LED

You will notice that some discs, or tracks within a disc, activate the Emphasis LED. This signifies that the recorded material had emphasis filtration used during the recording process. Emphasis is a recording industry equalization network, similar to phono RIAA equalization, intended for noise reduction.

G. QUESTIONS AND ANSWERS

Q. My CD player has both fibre optic and coaxial outputs. Which one should I use?

A. Given a choice, we prefer the AT&T optical link due to its ability to completely isolate the grounds between the digital source component and the Processor. This minimizes the possibility of ground loops in the digital components. The optional AT&T format also has the added benefit of substantially higher bandwidth than coax or the standard fibre optic interface..

Q. Will I damage my STEALTH if I leave the power "ON" all the time?

A. No. The Class "A" discrete analog circuits perform more consistently once they reach thermal equilibrium. This processor has been designed to be left on at all times. The STEALTH draws less than 25 watts out of the AC mains socket.

NOTE: For the protection of your processor we recommend disconnecting the AC cord from the wall outlet before any electrical storms or if you plan on being away from home for prolonged periods of time.

Q. Do I have to switch the Sampling Frequency when I go between my CD and DAT?

A. No. Your STEALTH automatically senses the input frequency and does all necessary switching.

Q. I am not getting any sound through the processor. What could be wrong?

A. Most likely there has been a simple mistake in installation. Check all connections IN and OUT from the processor. Check all power connections. Have you selected the correct source on your preamp? Check the front panel LED's for power supply stability. If you still have no sound, turn off the power and contact your dealer.

Q. I have some very fine audiophile interconnect cable which has superior sonic characteristics. Can I use this for my coaxial digital input?

A. You may experiment with any high quality cable. Do note, that most audio interconnect cable is not designed to carry the ultra high frequency information of the digital bit stream.

NOTE: For the STEALTH, we recommend non-capacitive coaxial cable which has a bandwidth in excess of 10MHZ and excellent shielding properties.

Q. While listening to my STEALTH I experience occasional periods of silence through my speakers. Is my processor malfunctioning?

A. Drop outs are caused by two primary reasons. First, drop outs can be caused by Data corruption. Corruption in the data may be due to a poor input connection, damaged or dirty source material, or interconnects which do not have a wide enough bandwidth. The second item that causes the processor to reset is the presence of a transient spike on the incoming AC power line. The processor is resetting all of its digital processing circuits so that it can be assured that all its circuits are properly synchronized. Try changing your source material and check your connections. If these are not the cause, speak with your dealer about obtaining different cabling. If you are using fiber optics, and source material and connections are not the problem, speak with your authorized dealer.

Q. Since I installed the processor in my system I have a low level hum that increases as I turn up the volume. There was no hum in my system until I added the processor. Is the processor malfunctioning?

A. The fact that there was no hum in your system until you added the processor indicates that you have a ground-loop problem. Often changing the interconnect to a fibre optic cable will eliminate this problem. The way the digital processor and digital source are connected to the AC mains often can be the cause of grounding problems. Lifting the ground on a specific component by means of a three prong to two prong AC adaptor (Cheater plug) will often solve the problem. Check for loose interconnect cables and or bad electrical connections. Consult your dealer or Krell for individual system suggestions if this hum persists.
